Document update history

Version	date	Revise
1.0	2025-03-30	First draft.
1.1	2025-10-10	1. Added CCEID:0XFEA1 Ignition Off or Parking Accumulated Time 2. Added CCEID:0X72 Storage Status 3. Added CCEID:0X39 Magnetic Card Reader Information 4. Added CCEID:0xF82E Overspeed Period Information Statistics 5. Added CCEID:0X6A Ignition Off Event Auxiliary Message 6. Added CCEID:0XDB Temperature Sensor Information 7. Added Event Code: 118: Input 9 Active 8. Added Event Code: 119: Input 9 Inactive 9. Added Event Code: 39: Photo 10. Added Event Code: 44: GSM Jamming 11. Added Event Code: 63: No GSM Jamming 12. Added Event Code: 122: SD State 13. Added Event Code: 144: Ignition On 14. Added Event Code: 145: Ignition Off
1.2	2025-11-06	1. Added CCEID:0XFEA0 driving state 2. Added CCEID:0XFE30 Over-speed Recovery Event Assistance Message

		- Added CCEID:0xFE2F Driving under the influence of fatigue - Added CCEID:0X4C Set of analog quantities
1.3	2025-11-18	Add CCE ID 0x40
1.4	2026-02-27	Add CCE ID 0x6E: Camera connection information (cache)
1.5	2026-04-09	Add CCE ID 0xFE2A 0xFE25
1.5	2026-04-20	Add CCE ID 0xFE31 Modify the descriptions of FE79 and FE80.
1.6	2026-04-28	- Added Event 675 - Added AEC101 related items: Parameter IDs: 0x5F, 0x60, 0x61, 0x62, 0x63, 0x64, 0x65, 0xFE60, 0xFE61 - Added the ID list of AEC101
1.7	2026-05-21	Added the CCE ID 0X6C
1.8	2026-06-01	Update the description of FE73

1 Command Format

1.1 Tracker Command Format

The data format is as follows:

\$\$<Data identifier><Data length>,<IMEI>,<CCE>,<Number of remaining cache records><Number of data packets><Data packet 1><Data packet 2><Data packet 3>...<Data packet N><*Checksum>\r\n

There is one or multiple data packets. When there are multiple data packets, the data is stored in the form of cache in the flash memory after the network is disconnected. After the network is connected normally, the tracker sends the cached data to the server in batches. When there is only one data packet, it means that this is a piece of real-time data.

The following is an example of data including only one data packet. The command content in CCE format is as follows:

Parameter	Description	Example
@@ / \$\$	@@: Indicates the GPRS data packet header sent from the server to the tracker. The header type is ASCII (hexadecimal: 0x40). \$\$: Indicates the GPRS data packet header sent from the tracker to the server. The header type is ASCII (hexadecimal: 0x24).	Hexadecimal: 0x24 0x24 ASCII: \$\$
Data identifier	Contains 1 byte. The type is the ASCII, and its value ranges from 0x41 to 0x7A .	Hexadecimal: 0x47 ASCII: G
Data length	Unit: byte. Type: decimal. Indicates the length of characters from the first separator "," to the ending character "\r\n" (including "," and "\r\n"), that is, the content underlined below. <i>\$\$<Data identifier><Data length>,<IMEI>,<Command type>,<Number of remaining cache records><Number of data packets><Data packet 1><Data packet 2><Data packet 3>...<Data packet N><*Checksum>\r\n</i>	Hexadecimal: 0x32 0x30 0x35 ASCII: 205
IMEI	Indicates the tracker's IMEI number. It has 15 digits generally.	Hexadecimal: 0x38 0x36 0x38 0x39 0x39 0x38 0x30 0x33 0x33 0x32 0x34 0x32

		0x33 0x33 0x36 ASCII: 868998033242336
CCE	CCE	Hexadecimal: 0x43 0x43 0x45 ASCII: CCE
The following data is hexadecimal:		
Number of remaining cache records	Contains 4 bytes; hexadecimal; little-endian	0x00 0x00 0x00 0x00 The number of remaining cache records is 0.
Number of data packets	Contains 2 bytes; hexadecimal; little-endian	0x01 0x00 The entire message contains only data packet.
The following is the detailed data of each data packet which needs to be parsed by using hexadecimal numbers. This protocol only describes data including only one data packet.		
Length of the current data packet	Contains 2 bytes; hexadecimal; little-endian. Indicates the length of characters from the "total number of ID in the current data packet" parameter to the last parameter ID of the current data packet.	0xAB 0x00 The length of the current data packet is 171 bytes.
Total number of ID in the current data packet	Contains 2 bytes; hexadecimal; little-endian	0x2E 0x00 There are 46 ID numbers in the data packet.
Number of 1-byte parameter ID	Value range: 0x00–0xFF The length of the following parameter ID numbers is 1 byte. The following data is not fixed, customers can choose to upload the required data.	0x0E There are 14 parameter ID numbers whose length is 1 byte. 0x00: The current data packet does not contain any parameter ID number whose length is 1 byte.
Event code	Parameter ID: 0x01 For details, see the section "Event Code." Data type: BYTE The ID: 0x01 parameter is reserved for the old model Old model: T366L\P99L\T399L(old FW)	0x23 The event code is 35.
GPS positioning status	Parameter ID: 0x05 0x01: The GPS positioning is valid. 0x00: The GPS positioning is invalid. Data type: BYTE	0x01 The GPS positioning is valid.
Number of satellites	Parameter ID: 0x06 Indicates the number of received GPS satellites. Data type: BYTE	0x0A The number of received GPS satellites is 10.
GSM signal strength	Parameter ID: 0x07 Value range: 0x00–0x31 Data type: BYTE	0x1C The GSM signal strength is

			28.
Output port status	Parameter ID: 0x14	Indicates the status values of eight output ports. Bits 0–7 correspond to status of output ports 1–8. Data type: BYTE	0x00 Converted to binary digits: 0000 0000 Output ports 1–8 is inactive.
input port status	Parameter ID: 0x15	Indicates the status values of eight input ports. Bits 0–7 correspond to status of input ports 1–8. Data type: BYTE	0x00 Converted to binary digits: 0000 0000 input ports 1–8 is inactive.
Geo-fence number	Parameter ID: 0x1B	The data is available only when the GPRS event code is 20 or 21. Data type: BYTE	0x00 No Enter Geo-fence or Exit Geo-fence alert is generated.
Temperature sensor No.	Parameter ID: 0x27	07 Indicates temperature sensor 7. The data is available only when the GPRS event code is 50 or 51. Data type: BYTE	
Dead Reckoning state	Parameter ID: 0x5B	00: invalid 01: Start the Dead Reckoning(DR) Data type: BYTE	0x00 Indicates that the DR Function is not enabled.
Clutch switch	Parameter ID: 0x93	01: The clutch pedal is pressed. 00: The clutch pedal is released. Upload data after reading it. Data type: BYTE	0x00 The clutch pedal is released.
Tachograph performance	Parameter ID: 0x94	01: performance analysis 00: normal performance Upload data after reading it. Data type: BYTE	0x00 The tachograph performance is normal.
Parking brake switch	Parameter ID: 0x95	01: Apply the brake. 00: Do not apply the brake. Upload data after reading it. Data type: BYTE	0x00 Do not apply the brake.
Cruise control system	Parameter ID: 0x96	01: The cruise control system is switched on. 00: The cruise control system is switched off. Upload data after reading it. Data type: BYTE	0x00 The cruise control system is switched off.
Accelerator pedal position (%)	Parameter ID: 0x97	1-byte hexadecimal data Upload data after reading it. Data type: BYTE	0x14 You press down 20% of the accelerator pedal of your vehicle.
CAN bus fuel	Parameter	1-byte hexadecimal data	0x23

level (%)	ID: 0x9D	Upload data after reading it. Data type: BYTE	The fuel level left is 35%.
Actual engine torque (%)	Parameter ID: 0x9E	1-byte hexadecimal data Upload data after reading it. Data type: SINT8	0x12 The actual engine torque is 18%.
Actual engine torque at current speed (%)	Parameter ID: 0xA1	1-byte hexadecimal data Upload data after reading it. Data type: BYTE	0x12 The actual engine torque at current speed is 18%.
The status of the input and output ports of AEC101	Parameter ID: 0x5F	Bit 0 to Bit 7: Input status; corresponding to the input states of the external box's input ports 1 to 8 Bit 8 to Bit 15: Output status; corresponding to the states of the external box's OUT1 to OUT4 1: Activated 0: Not activated The data will be uploaded only when the data from AEC101 is read. Data type: WORD	
driving state	Parameter ID: 0xFE0	0: Engine off state; 1: Engine starting and parking state; 2: Engine starting and driving state;	
Number of 2-byte parameter ID		Value range: 0x00–0xFF The length of the following parameter ID numbers is 2 bytes. The following data is not fixed, customers can choose to upload the required data.	0x10 There are 16 parameter ID numbers whose length is 2 bytes. 0x00: The current data packet does not contain any parameter ID number whose length is 2 bytes.
Speed	Parameter ID: 0x08	Unit: km/h; little-endian Data type: WORD	0x15 0x00 The driving speed is 21 km/h.
Driving direction	Parameter ID: 0x09	The unit is degree. When the parameter value is 0 , the direction is due north. The parameter value ranges from 0 to 359 . Little-endian. Data type: WORD	0x66 0x00 The driving direction is 102 degrees.
Horizontal dilution of precision (HDOP)	Parameter ID: 0x0A	Value range: 5–999 Unit: 1/10; little-endian Data type: WORD	0x13 0x00 The HDOP is 1.9.
Altitude	Parameter ID: 0x0B	Unit: meter; little-endian Data type: SINT16	0x2D 0x00 The altitude is 45 meters.

AD1	Parameter ID: 0x16	Analog <AD1>; little-endian Voltage formula of analog: AD1/100 Data type: WORD	0x00 0x00 Convert the digits to decimal digits: 0 $0/100 = 0$ The AD1 voltage is 3.95 V.
AD2	Parameter ID: 0x17	Analog <AD2>; little-endian Voltage formula of analog: AD2/100 Data type: WORD	0x00 0x00 Convert the digits to decimal digits: 0 $0/100 = 0$ The AD2 voltage is 3.95 V.
AD3	Parameter ID: 0x18	Analog <AD3>; little-endian Voltage formula of analog: AD3/100 Data type: WORD	0x00 0x00 Convert the digits to decimal digits: 0 $0/100 = 0$ The AD3 voltage is 3.95 V.
Built-in battery	Parameter ID: 0x19	Battery analog <AD4>; little-endian Voltage formula of analog: AD4/100 When the battery power is full, the voltage is 4.2 V. When the battery power is empty, the voltage is 3.4 V. Formula of remaining battery power (%): $(AD4/100 - 3.4)/0.8 \times 100\%$ Data type: WORD	0xA0 0x01 Convert the digits to decimal digits: 416 $416/100 = 4.16$ The voltage is 4.16V. The remaining battery power is 99%.
external power	Parameter ID: 0x1A	External power analog <AD5>; little-endian Voltage formula of analog: AD5/100 Note: When the external power supply is disconnected, the voltage of AD5 is about 2 V instead of 0. Data type: WORD	0x51 0x05 Convert the digits to decimal digits: 1366 $1366/100 = 13.66$ The voltage of the external power supply is 13.66 V.
Fuel level (%)	Parameter ID: 0x29	Little-endian. After the digits are converted to decimal digits, the converted value divided by 10000 is the actual value. Data type: WORD	0x7A 0x0D Convert the digits to decimal digits: 3450 The fuel level is 34.50%.
New event code	Parameter ID: 0x40	For the specific definition, please refer to the event code table. Data type: BYTE	
AD6	Parameter ID: 0x41	Analog <AD6>; little-endian Voltage formula of analog: AD6/100 Data type: WORD	0x00 0x00 Convert the digits to decimal digits: 0 $0/100 = 0$ The AD6 voltage is 0.
Camera connection	Parameter ID: 0x6E	Cache information of the connected camera. Little-endian.	0x03 0x00 Indicates that cameras CH1

information(cache)		BIT0 - BIT15: Corresponding to the connection information of cameras 1 to 16. 1 indicates that camera CH1 is connected; 0 indicates that camera CH1 is disconnected. Data type: WORD	and CH2 are connected.
Vehicle speed (based on the tachograph) (km/h)	Parameter ID: 0x91	2-byte hexadecimal data Upload data after reading it. Data type: WORD	0x15 0x00 Convert the digits to decimal digits: 21 The vehicle speed is 21 km/h.
Vehicle speed (based on the wheel) (km/h)	Parameter ID: 0x92	2-byte hexadecimal data Upload data after reading it. Data type: WORD	0x15 0x00 Convert the digits to decimal digits: 21 The vehicle speed is 21 km/h.
Engine speed (rpm)	Parameter ID: 0x99	2-byte hexadecimal data Upload data after reading it. Data type: WORD	0x12 0x04 Convert the digits to decimal digits: 1042 The engine rotational speed is 1042 rpm.
Engine coolant temperature (deg C)	Parameter ID: 0x9C	2-byte hexadecimal data Upload data after reading it. Data type: SINT16	0x32 0x00 Convert the digits to decimal digits: 50 The engine coolant temperature is 50°C.
Ambient air temperature (deg C)	Parameter ID: 0x9F	2-byte hexadecimal data Upload data after reading it. Data type: SINT16	0x28 0x00 Convert the digits to decimal digits: 40 The ambient air temperature is 40°C.
Geo-fence number	Parameter ID: 0xFE90	little-endian This data is valid only if GPRS event code 20,21. Data type :STRUCT	0x01 0x00 The enclosure number that triggers the entry/exit Geo-fence alarm is 1.
Engine coolant level	Parameter ID: 0xF826	little-endian Data will only be uploaded if read; Data type: WORD	B0 09 2480=24.80%
Over-speed Recovery Event Assistance Message	Parameter ID: 0xFE30	little-endian Data type: WORD This data is only available when obtaining through GPRS event code 138.	60 00 Indicates that the maximum speed during the speeding period is 96 km/h.
A84 input port	Parameter	Data type: WORD	00 01

status	ID: 0xFE25	Status values of 12 input ports Bits 0 to 11 correspond to the states of A84 input ports 1 to 12.	0000 0000 0000 0001 Means input1 is active
Number of 4-byte parameter ID		Value range: 0x00–0xFF The length of the following parameter ID numbers is 4 bytes. The following data is not fixed, customers can choose to upload the required data.	0x0F There are 15 parameter ID numbers whose length is 4 bytes. 0x00: The current data packet does not contain any parameter ID number whose length is 2 bytes.
Latitude	Parameter ID: 0x02	Unit: millionth of a degree; little-endian Data type: SINT32	0xE6 0x87 0x57 0x01 Convert the digits to decimal digits: 22513638 The latitude is 22.513638 degrees.
Longitude	Parameter ID: 0x03	Unit: millionth of a degree; little-endian Data type: SINT32	0xE6 0x5F 0xCC 0x06 Convert the digits to decimal digits: 114057190 The longitude is 114.057190 degrees.
Date and time	Parameter ID: 0x04	Contains 4 bytes; little-endian Unit: second Starting time: 1 January, 2000, 00:00:00 am. Data type: DWORD	0xEA 0x8D 0xA7 0x22 Convert the digits to decimal digits: 581406186
Mileage	Parameter ID: 0x0C	Indicates the total mileage. Unit: meter; little-endian Data type: DWORD	0x56 0x05 0x00 0x00 Convert the digits to decimal digits: 1366 The total mileage is 1366 meters.
Run time	Parameter ID: 0x0D	Indicates the total time. Unit: second; little-endian Data type: DWORD	0x96 0x1B 0x00 0x00 Convert the digits to decimal digits: 7062 The run time is 7062 seconds.
System flag	Parameter ID: 0x1C	The data is available only when the GPRS event code is 35. Bit 0: Whether to modify the EEP2 parameter. When the parameter value is 1, the EEP2 parameter is modified. Bits 1–31: reserved. Data type: DWORD	0x00 0x00 0x00 0x00 Converted to binary digits: 0000 0000 0000 0000 0000 0000 0000 0000
RFID ID	Parameter	Indicates the ID number of a RFID card.	0xD7 0x9D 0xD1 0x00

	ID: 0x25	After RFID swipe and ACC ON, the RFID ID number will be uploaded. After ACC OFF, the RFID ID number will not be uploaded. Data type: DWORD	The RFID ID number is 13737431.
Input port status	Parameter ID: 0x42	Bits 0–31 correspond to status of input ports 1–31. When the parameter value is 0, the port is inactive. When the parameter value is 1, the port is active. Data type: DWORD	0x00 0x00 0x00 0x04 Converted to binary digits: 0000 0000 0000 0000 0000 0000 0000 0100 The input port 3 is active, while other input ports are inactive.
Total fuel consumption (L)	Parameter ID: 0x98	4-byte hexadecimal data Data type: DWORD	0x01 0x02 0x00 0x00 Convert the digits to decimal digits: 513 The total fuel consumption is 513 L.
Total engine run time (h)	Parameter ID: 0x9A	Little-endian. After the digits are converted to decimal digits, the converted value divided by 10 is the actual value. Data type: DWORD	0x12 0x34 0x00 0x01 Convert the digits to decimal digits: 16790546 The total engine run time is 1679054.6 hours.
High resolution vehicle distance (m)	Parameter ID: 0x9B	4-byte hexadecimal data Data type: DWORD	0x11 0x22 0x00 0x00 Convert the digits to decimal digits: 8712 The total mileage is 8712 meters.
High resolution total fuel consumption (L)	Parameter ID: 0xA0	Little-endian. After the digits are converted to decimal digits, the converted value divided by 1000 is the actual value. Data type: DWORD	0x12 0x00 0x01 0x00 Convert the digits to decimal digits: 65554 The total fuel consumption is 65.554 L.
Fuel consumption rate (L/H)	Parameter ID: 0xA2	Little-endian. After the digits are converted to decimal digits, the converted value divided by 100 is the actual value. Data type: DWORD	0x12 0x00 0x02 0x00 Convert the digits to decimal digits: 131090 The fuel consumption rate is 1310.90 L/H.
Axle weight (kg)	Parameter ID: 0xA3	Little-endian. After the digits are converted to decimal digits, the converted value divided by 10 is the actual value. Data type: DWORD	0x12 0x34 0x00 0x00 Convert the digits to decimal digits: 13330 The axle weight is 1333.0 kg.
Service distance (km)	Parameter ID: 0xA4	4-byte hexadecimal data Data type: SINT32	0x22 0x30 0x00 0x00 Convert the digits to

			decimal digits: 12322 The service distance is 12322 km.
Instantaneous fuel consumption (km/L)	Parameter ID: 0xA5	Little-endian. After the digits are converted to decimal digits, the converted value divided by 1000 is the actual value. Data type: DWORD	0x12 0x56 0x00 0x00 Convert the digits to decimal digits: 22034 The instantaneous fuel consumption is 22.034 km/L.
Vehicle battery voltage	Parameter ID: 0XF825	Little-endian format, after conversion to decimal, the real value is obtained by dividing by 100. Data will only be uploaded if available. Data type: DWORD	0x12 0x00 0x02 0x00 1310.90V
Driving under the influence of fatigue	Parameter ID: 0XFE2F	Seconds (unit) This data is only available when obtaining through GPRS event code 136.	10 0E 00 00:3600s
Single trip fuel usage	Parameter ID: 0XF827	Little-endian format, after conversion to decimal, the real value is obtained by dividing by 100. Data will only be uploaded if available. Data type: DWORD	0x01 0x02 0x00 0x00 Fuel consumption for this trip is 513L
Ignition Off or Parking Accumulated Time	Parameter ID: 0XFEA1	Unit in seconds, used to upload ignition off or parking time; uploaded during ACC ON event	
Number of unfixed-byte parameter ID		Value range: 0x00–0xFF The length of the following parameter ID numbers is 8 or 12 bytes, or is unfixed. The ordering of parameter ID numbers is not fixed. For details, see the parameter ID table. The following data is not fixed, customers can choose to upload the required data.	0x01 There is one unfixed-byte parameter ID number. 0x00: The current data packet does not contain any parameter ID number whose length is unfixed.
Current base station info	Parameter ID: 0x0E	<Data length><MCC><MNC><LAC><CELL_ID><RX_LEV EL> Data length: hexadecimal; indicates the length of the base station data. Unit: byte. MCC: 16-bit unsigned; little-endian; indicates the Mobile Country Code. MNC: 16-bit unsigned; little-endian; indicates the Mobile Network Code. LAC: 16-bit unsigned; little-endian; indicates	0x0C 0xCC 0x01 0x01 0x00 0x45 0xA5 0x8B 0xD4 0xE9 0x01 0xBB 0xFF 0x0C: The data length is 12 bytes. 0xCC 0x01: The MCC is 460. 0x01 0x00: The MNC is 01. 0x45 0xA5: The LAC is 42309. 0x8B 0xD4 0xE9 0x01: The

		the Location Area Code. CELL_ID: 32-bit unsigned; little-endian; indicates the cell ID. RX_LEVEL: 16-bit signed; little-endian; indicates the signal strength. Data type: STRUCT	cell ID is 32101515. 0xBB 0xFF: The signal strength is -69 dbm.
Picture name	Parameter ID: 0x28	The data is available only when the GPRS event code is 39. Time unit: second. Start time: 1 January, 2000, 00:00:00 am. Data type: STRUCT Only T633 models are supported.	0xCB 0x0F 0x23 0x19 0x01 0x1E 0x0C 0x00 There are two pieces of DWORD data: 0x19230FCB 0x000C1E01. 0x19230FCB: Indicates the date and time, that is, 130513024323. 0x000C1E01: Indicates the last part of the file name ,that is, C1E01. The file name is 130513024323_C1E01.jpg.
Temperature sensor 1	Parameter ID: 0x2A	Little-endian Data type: STRUCT	0x01 0x09 0x1A 01: Indicates sensor 01. 09 1A: signed; 2 bytes; little-endian. The temperature is 66.65°C.
Temperature sensor 2	Parameter ID: 0x2B	Little-endian Data type: STRUCT	0x01 0x09 0x1A 01: Indicates sensor 01. 09 1A: signed; 2 bytes; little-endian. The temperature is 66.65°C.
Temperature sensor 3	Parameter ID: 0x2C	Little-endian Data type: STRUCT	0x01 0x09 0x1A 01: Indicates sensor 01. 09 1A: signed; 2 bytes; little-endian. The temperature is 66.65°C.
Temperature sensor 4	Parameter ID: 0x2D	Little-endian Data type: STRUCT	0x01 0x09 0x1A 01: Indicates sensor 01. 09 1A: signed; 2 bytes; little-endian. The temperature is 66.65°C.
Temperature sensor 5	Parameter ID: 0x2E	Little-endian Data type: STRUCT	0x01 0x09 0x1A 01: Indicates sensor 01. 09 1A: signed; 2 bytes; little-endian. The temperature is 66.65°C.

Temperature sensor 6	Parameter ID: 0x2F	Little-endian Data type: STRUCT	0x01 0x09 0x1A 01: Indicates sensor 01. 09 1A: signed; 2 bytes; little-endian. The temperature is 66.65°C.
Temperature sensor 7	Parameter ID: 0x30	Little-endian Data type: STRUCT	0x01 0x09 0x1A 01: Indicates sensor 01. 09 1A: signed; 2 bytes; little-endian. The temperature is 66.65°C.
Temperature sensor 8	Parameter ID: 0x31	Little-endian Data type: STRUCT	0x01 0x09 0x1A 01: Indicates sensor 01. 09 1A: signed; 2 bytes; little-endian. The temperature is 66.65°C.
Camera status	Parameter ID: 0x49	<ID_Len><Number><Status> ID_Len: The length of this ID, 1 byte Number: The total number of cameras supported by this device, 1 byte, maximum 64 Status: 8 bytes, little-endian format; bit0: 1 indicates that camera CH1 is connected; 0 indicates that camera CH1 is disconnected bit64: 1 indicates that camera CH64 is connected; 0 indicates that camera CH64 is disconnected.	
Currently using network information	Parameter ID: 0x4B	The network information that the device is connecting to. <ID_Len><version><Type><DescriptorLen><Descriptor> ID Len: 1 byte Version: 1 byte, 0x01 by default Type: The type of network being connected, 1 byte. 0: No Network, 1: Mobile Network, 2: WIFI (Reserved), 3: LAN (Reserved) DescriptorLen: the length of the network descriptor, 1 byte, range: 0~32 Descriptor: Network descriptor, string Data type:STRUCT	
Total analog quantity	Parameter ID: 0x4C	<ID_Len><number><AD1_no><AD1_voltage>... <ADn_no><ADn_voltage> ID_Len: The length of this ID, 1 byte number: The current number of analog quantities being uploaded, up to 32 analog quantities, 1 byte ADn_no: Number, 1-32, indicating the external AD number; 33: indicating battery voltage; 34: indicating external power voltage; others are reserved ADn_voltage: Voltage, in mV, 2 bytes	
ADAS/DMS	Parameter	<ID_Len><AlarmProtocol><AlarmType><PhotoName>	

Additional Info	ID: 0XFE31	ID_Len: The length of this ID, 1 byte AlarmProtocol: Protocol version number:, 1 byte When AlarmProtocol is 0X04: AlarmType: Sinopec DMS alarm, 1 byte; defined as follows: 0x01: Fatigue driving alarm 0x02: Making phone calls alarm 0x03: Smoking alarm 0x04: Distraction driving alarm 0x05: Driver abnormality alarm 0x06 - 0x0F: User-defined 0x10: Active snapshot event 0x11: Driver change event 0x12 - 0x1F: User-defined PhotoName: NUM + TYPE1 + ID1 +... TYPEn+IDn NUM: 1 byte, number of media resources TYPE: 1 byte, media type, 0: image, 1: audio, 2: video ID: 4 bytes, media ID When AlarmProtocol is 0X03: AlarmType: Sinopec ADAS alarm, 1 byte; defined as follows: 0x01: Forward collision alarm 0x02: Lane departure alarm 0x03: Close distance alarm 0x04: Pedestrian collision alarm 0x05: Frequent lane changing alarm 0x06: Road sign over-limit alarm 0x07 to 0x0F: User-defined 0x10: Road sign recognition event 0x11: Active snapshot event 0x12 to 0x1F: User-defined PhotoName: NUM + TYPE1 + ID1 +... Facial Recognition Alarm Assistance Information	Parameter ID: 0XFE6A	<ID_Len><AlarmProtocol><AlarmType><PhotoName> ID_Len: The length of this ID, 1 byte AlarmProtocol: Protocol version number:, 1 byte When AlarmProtocol is 0X01: AlarmType: Alarm type, 1 byte; defined as follows: 1: Driver login successful 2: Driver login failed 3: Face recognition successful 4: Change of driver 5: Delete of driver PhotoName: Photo name, in string format, fixed 64 bytes. If there is no photo, all are 0x00 This data is only available when obtaining the GPRS event code 647.
TPMS data 1	Parameter ID:	<ID_Len>< Number of tire pressure >< TPMS 1>< TPMS 2>...< TPMS n> ID_Len:1 byte

	OXFEF2	Number of tire pressure: 1 byte; Up to 16 tire pressure data are supported, more than 16 tire pressure data will be extended using CCE ID: FEE3. TPMS 1: <pre>typedef struct byte Num;// Tyre position byte ID[3];//ID, Little-endian word tpms_value;// Tire pressure byte temp; // Temperature byte status;// status</pre> Tyre position: Bits 7–5: indicate the vehicle's head part or trailer. 000(B): vehicle's head part; 001(B): trailer 1; 010(B): trailer 2; 011(B): trailer 3; 100(B): trailer 4. Bits 4–0: indicate the tire number. For example, 00001(B), indicating the first tire. ID: indicates a tire pressure sensor's ID number; 4 bytes; unsigned; hexadecimal. Tire pressure: 2 bytes; unsigned; hexadecimal; formula: obtained value x 0.025; unit: bar. Temperature: indicates the tire temperature; 1 byte; unsigned; hexadecimal; formula: obtained value - 50; unit: °C. Status: indicates the tire status; 1 byte; unsigned; hexadecimal. Bit 7: indicates the battery voltage status of the transmitter. 0: normal voltage; 1: low voltage. Bit 6: Whether to receive data from the transmitter. When you do not receive data from the transmitter within 15 minutes, the parameter value will be reset to 1. Bit 5: reserved. Bit 4: When the parameter value is 1, the air pressure is high. Bit 3: When the parameter value is 1, the air pressure is low. Bit 2: indicates temperature status. 1: high temperature; 0: normal temperature. Bits 1–0: indicate the alert status. 00: no alert; 01: fast air leak alert; 10: slow air leak alert; 11: tire inflation alert.
TPMS data 2	Parameter ID: OXFEF3	<ID_Len>< Number of tire pressure >< TPMS 1>< TPMS 2>...< TPMS n> ID_Len:1 byte Number of tire pressure: 1 byte; TPMS 1: <pre>typedef struct byte Num;// Tyre position byte ID[3];//ID, Little-endian word tpms_value;// Tire pressure byte temp; // Temperature byte status;// status</pre>

		Tyre position : Bits 7–5: indicate the vehicle's head part or trailer. 000(B): vehicle's head part; 001(B): trailer 1; 010(B): trailer 2; 011(B): trailer 3; 100(B): trailer 4. Bits 4–0: indicate the tire number. For example, 00001(B), indicating the first tire. ID: indicates a tire pressure sensor's ID number; 4 bytes; unsigned; hexadecimal. Tire pressure: 2 bytes; unsigned; hexadecimal; formula: obtained value x 0.025; unit: bar. Temperature: indicates the tire temperature; 1 byte; unsigned; hexadecimal; formula: obtained value - 50; unit: °C. Status: indicates the tire status; 1 byte; unsigned; hexadecimal. Bit 7: indicates the battery voltage status of the transmitter. 0: normal voltage; 1: low voltage. Bit 6: Whether to receive data from the transmitter. When you do not receive data from the transmitter within 15 minutes, the parameter value will be reset to 1. Bit 5: reserved. Bit 4: When the parameter value is 1, the air pressure is high. Bit 3: When the parameter value is 1, the air pressure is low. Bit 2: indicates temperature status. 1: high temperature; 0: normal temperature. Bits 1–0: indicate the alert status. 00: no alert; 01: fast air leak alert; 10: slow air leak alert; 11: tire inflation alert. Note: This ID data is used only when the number of tire pressure is set to more than 16, for the extension data of FEE2.
ASPC People Counter	0XFE96	<ID_Len>< version number >< sensor 1>< sensor 2>< sensor 3>< sensor 4>< All sensor data > Version: 1 byte: detects the sensor version. Sensors 1 to 4 are dynamic data. If the device is connected to only one sensor, data is uploaded from only one sensor. Sensor: little-endian. The data structure is as follows <pre>typedef struct { byte number (1 byte) ; // Sensor label. byte door_number (1 byte) ; // door label。 0:NULL 1:door1 2:door2 3:door3 4:door4 byte state (1 byte) ; // Sensor status: 0: invalid 1: IO detection door opening 2: IO detection shutdown // 3: IN Geo-fence 4: OUT Geo-fence dword up_car (4 byte) ; // The number of people getting on this time dword down_car (4 byte) ; // The number of people getting off this time }</pre>

Temperature sensor information	Parameter ID: 0xDB	<ID len><version><temp_num><temp1_data>...<tempN_data> ID length: 1 byte, length of this ID data Version: 1 byte, version number If the version number is 1, then: temp_num: 1B, Number of temperature sensors tempN_data: Thermal data, structured as follows: struct { byte No; // Temperature sensor number. 0 indicates unregistered. byte SN[8]; // Thermal sensor SN, such as 28 D8 82 23 04 00 00 5 short int value; // Temperature value, 09 1A: 2 signed bytes, little-endian format, representing a temperature of 66.65 }; For uploading the temperature sensor's serial number, SN, temperature value, etc., default option is not selected.
A84 event auxiliary	Parameter ID:	<len><data> <len>Current data length

message	0xFE2A	<data> 05 05 00 00 00 05: Represents the small event number of A84, with a value range of 1 to 12, 17 to 28, 1 to 12 represent activation events of A84, such as 1 indicating port 1 activation; 17 to 28 represent deactivation events of A84, such as 17 indicating port 1 deactivation, and so on. 05 00 00 00: Indicates an activation time of 5 seconds. (Data type: STRUCT)
AEC101 Analog Data	Parameter ID: 0X60	<ID_Len><number><AD1_no><AD1_voltage>... <ADn_no><ADn_voltage> ID_Len: The length of this ID, 1 byte number: The current number of analog quantities being uploaded, up to 8 analog quantities, 1 byte ADn_no: Number, 1-8, indicating the external AD number; ADn_voltage: Voltage, in units of 10 mV, 2 bytes Data type: STRUCT
AEC101 Incident Information	Parameter ID: 0X61	<ID_Len><Event><Activation time> ID_Len: The length of this ID, 1 byte Event: Represents the minor event number of AEC101, with the range being from 1 to 8. 1 to 8 indicate the activation events of AEC101, such as 1 indicating the activation of port 1, 17 to 24 indicating the non-activation events of AEC101, such as 17 indicating the non-activation of port 1, and so on. Activation time: Indicates an activation time of 5 seconds Data type: STRUCT
AEC101 CAN data parsing information Group A	Parameter ID: 0X62	<ID_Len><version><id num (the data is a one-byte ID quantity)><id><data>.....<id num (the data is a two-byte ID quantity)><id><data>.....<id num (the data is a four-byte ID quantity)><id><data>..... version: Using version 0x01 id num: The quantity of one-byte data IDs ID: Data type - one byte or multiple bytes (if the first byte is F8~FF, it is an extended ID. Continue to look for the next byte, such as F801) data: Data ID number: 2-byte data ID quantity ID: Data type 1 byte or multiple bytes (if the first byte is F8~FF, it is an extended ID. Continue to look for the next byte, such as F801) data: Data ID number: 4-byte data ID quantity ID: Data type 1 byte or multiple bytes (if the first byte is F8~FF, it is an extended ID. Continue to look for the next byte, such as F801) data: Data

		Please refer to the ID list of AEC101 for the specific ID number. Data type: STRUCT
AEC101 CAN data parsing information Group B	Parameter ID: 0X63	Same as above
AEC101 CAN data parsing information Group C	Parameter ID: 0X64	Same as above
AEC101 CAN data parsing information Group D	Parameter ID: 0X65	Same as above
Custom data	Parameter ID: 0X6C	<id_len><version><custom_data> ID_Len: Length of this ID, 1 byte version: Version number Version 0x01 corresponds to the data: custom_data: string data Data type: STRUCT
CAN periodically uploads ID Group A	Parameter ID: 0XFE60	Data length (1 byte) + ID1 + ID1 content... + IDn + IDn content. The ID is fixed at 4 bytes and the ID content is fixed at 8 bytes. There can be a maximum of 16 IDs, so n can be at most 16. Data type: STRUCT Bind and upload with the 123 incident
CAN periodically uploads ID Group B	Parameter ID: 0XFE61	Data length (1 byte) + ID1 + ID1 content... + IDn + IDn content. The ID is fixed at 4 bytes and the ID content is fixed at 8 bytes. There can be a maximum of 16 IDs, so n can be at most 16. Data type: STRUCT Bind and upload with the 123 incident
The current data packet ends here.		
*	Contains 1 byte. It is used to separate the command content from the checksum. ASCII (hexadecimal: 0x2A)	*
Checksum	Contains 2 bytes. Indicates the sum of hexadecimal characters from the packet header "\$\$" to the asterisk "*" (including the packet header and asterisk). <u>\$\$<Data identifier><Data length><IMEI><Command type><Hexadecimal data packet><*Checksum></u> \r\n	If the sum result is 0x27 0x62 , send the checksum 62 (low byte 0x62) in ASCII format, that is, 0x36 0x32 . Hexadecimal: 0x36 0x32 ASCII: 62
\r\n	Contains 2 bytes. This is an ending character.	\r\n

	The type is ASCII (hexadecimal: 0x0D,0x0A).	
--	---	--

Notes:

data type	Description	transmission rule
BYTE	Unsigned single-byte integer (bytes, 8 bits)	Transmit in byte stream
WORD	Unsigned double-byte integer (word, 16 bits)	Little-endian
DWORD	Unsigned four-byte integer (double word, 32-bit)	Little-endian
BYTE[n]	N byte	Transmit in byte stream
BCD[n]	8421 code, n bytes	Transmit in byte stream
STRING	GBK code, if no data, blank	Little-endian
SINT8	Signed single byte	Transmit in byte stream
SINT16	Signed double byte	Little-endian
SINT32	Signed four bytes	Little-endian
STRUCT	Based on the data analysis description decision	Transfer as defined by the structure

```

2.2 Divide the message structure

the message structure can be divided into:

Start sign	Message Header	Delimiter 0x 2C	Message body	Delimiter 0x2A	Verification Code	End Sign
------------	----------------	-----------------	--------------	----------------	-------------------	----------

1. yellow in the source data , as follows:

24 24 is converted to ASCII code \$ \$, which is the start mark of the message

2. The message header is marked in green in the source data , as follows:

50 31 30 36 34 2C 38 36 31 35 38 35 30 34 30 34 39 34 34 36 38 2C 43 43 45

Start Byte	Fields	type of data	Byte Information	explain
0	Packet Identifier	Byte	50	Data packet identifier, the sender needs to be consistent with the receiver
1	Data length	String [n1]	31 30 36 34	ASCII is 1064 , which means the length from the first delimiter " , " (inclusive) to the end character " \r\n " (inclusive) is 1064 bytes, where n 1=4 .
1 + n 1	Delimiter	Byte	2C	Separator, half-width comma
2 + n 1	IMEI number	String [15]	38 36 31 35 38 35 30 34 30 34 39 34 34 36 38	ASCII is 861585040494468 , which indicates the IMEI number of the device. Generally, it is 1 to 5 bytes. There will be additional instructions for special cases.
17+n 1	Delimiter	Byte	2C	Separator, half-width comma
2 0+ n 1	Protocol Name	String[3]	43 43 45	ASCII is CCE, indicating the protocol name

3. The delimiter 0x 2 C is marked in light blue , as shown below
2 C is converted to ASCII code as a half-width comma (,) , which is a separator
4. The end sign is marked in purple , as follows
0D 0 A is converted to ASCII code for carriage return and line feed (\ r \ n)
5. The verification code is marked in dark blue as follows
3 2 30 is the check code, which is converted to ASCII as 2 3 , which is the cumulative sum of the entire GPRS data packet (the sum of all data from the beginning to the check code, excluding the check code and the end character)
6. The separator is marked in red , as follows
2A The delimiter is converted to ASCII asterisk (*) and used to separate the message body and the check code.
7. The remaining unmarked parts of the source message data are all data bodies. For parsing, see 5.3 , Message Body Parsing Example

2.3 Message body parsing example

1. Message body structure

Cache remaining quantity	Number of packets	Packet 1	Total length of data packet 1	Packet 2	Total length of data packet 2		Packet n	Total length of data packet n
--------------------------	-------------------	----------	-------------------------------	----------	-------------------------------	------	----------	-------------------------------

Start Byte	Fields	type of data	Description and Requirements
0	Cache remaining quantity	D Word	
4	Number of packets	Word	There are several data packets in the whole data
6	Total length of data packet 1	Word	
8	Packet 1	Byte[N1]	N1 is the total length of data packet 1.
N1+8	Total length of data packet 2	Word	
N 1+10	Packet 2	Byte[N2]	N1 is the total length of data packet 2
...			
$\sum_{i=1}^{m-1} N_i + 2m + 4$	Total length of data packet m	Word	
$\sum_{i=1}^{m-1} N_i + 2m + 6$	Packet m	Byte [Nm]	Nm is the total length of data packet m

All byte data of the message body are excerpted as follows:

19 00 00 00 0C 00

00 14 00 15 02 09 08 00 00 09 17 01 0A 08 00 0B 23 00 16 00 00 17 00 00 19 A2 01 1A 26 05 40 23 00 06 02 E8 87 57
01 03 D7 5F CC 06 04 4D C0 B5 24 0C 80 68 00 00 0D 00 00

2. the first four bytes of the message body are the remaining number of cache bytes, which are marked in dark

green as follows:

1 9 00 00 00 is the little-endian byte order (see 1.3 , the same below), so we know that the remaining number of cache entries is 0x 00000019 , which is 25 in decimal , that is, the remaining number of cache entries is 25 .

- The two bytes after the remaining amount in the cache are the number of packets, which are marked in purple , as shown below

0C 00 is the little endian byte order, so the number of packets is 0x 000 C, which is 12 in decimal, meaning there are 12 packets in total.

- The following bytes are arranged in the form of (packet length, data packet), so 1 or 2 packets can be divided in sequence. The length of each packet is marked in gray , and line breaks are used to separate them to make the structure clear. It can be clearly seen that the data body is exactly 1 or 2 packets, which is consistent with our analysis results. Since the analysis method between packets is consistent, only the first packet is analyzed here.

2.4 Packet parsing example

- First, the first data packet is extracted as follows.

```
15 00 05 05 01 06 0A 07 00 14 00 15 02 09 08 00 00 09 1F 01 0A 07 00 0B 26 00 16 00 00 17 00 00 19 A2 01 1A 26
05 40 23 00 06 02 D7 87 57 01 03 48 60 CC 06 04 DE BF B5 24 0C 80 68 00 00 0D E4 A0 03 00 1C 01 00 00 00 01 49 09
04 01 00 00 00 00 00 00 00
```

Start Byte	Fields	type of data	Description and Requirements
0	Total number of packet IDs	Word	
2	Total number of single-byte IDs	Byte	The value of this field is N 1
3	Single byte ID information	Byte[2*N1]	For details of ID, please see 3.Detailed information of ID, the same below
3 +2* N 1	Total number of double-byte IDs	Byte	The value of this field is N 2
5 +2* N 1	Double-byte ID information	Byte [3*N2+p]	30 parameter is not included , p = 0 , otherwise p = 1
5 +2*N1+3*N2+p	Total number of four-byte IDs	Byte	The value of this field is N 3
7+2*N1+3*N2+p	Four-byte ID information	Byte [5*N3+ q]	FE2F parameter is not included , q = 0 , When the 0x FE2F parameter is included, q = 1
7+2*N1+3*N2+ 5* N 3+p+ q	Total number of non-fixed byte IDs	Byte	
9+2*N1+3*N2+ 5* N 3+p+ q	Non-fixed byte ID information	Byte [M]	Since it is a non-fixed byte, it is impossible to determine M

- the following analysis:

- Total number of packet IDs

in yellow , 1 5 00 is the little-endian byte order, and the hexadecimal 0x 0015 is converted to decimal 2 1 , indicating that the total number of IDs of the data packet is 2 1

b) Total number of single-byte IDs

in green , 0x 05 is converted to decimal 5, indicating that the total number of single-byte IDs is 5. Refer to Table 5-4-1 , that is, N 1=5

c) Single byte ID information

Marked in light blue , the data is as follows

05 01 06 0A 07 00 14 00 15 02

Single Byte ID detailed analysis as shown:

ID	content	Description and explanation
0 5	0 1	Positioning status is valid
0 6	0A	The number of satellites is 1 0
0 7	0 0	GSM signal strength is 0
1 4	0 0	The output port status is 0x 00
1 5	0 2	The input port status is 0x 00

d) Total number of double-byte IDs

Use dark blue to mark, 0x 09 is converted to 1, which is 9 in base 0, indicating that the total number of double-byte IDs is 5, that is, N 2=9

e) Double-byte ID information

Since it does not contain parameter 0xFE 30 , p = 0. Purple is used to mark the data. The excerpt is as follows:

08 00 00 09 1F 01 0A 07 00 0B 26 00 16 00 00 17 00 00 19 A2 01 1A 26 05 40 23 00

detailed analysis of double-byte IDs as shown

ID	content	Description and explanation
08	00 00	The current speed value is 0km/ h
09	1F 01	1F 01 is the little endian byte order, 0x 011F is converted to decimal as 287 , so it means the driving direction is 287 °, due north is 0°
0A	07 00	07 00 is the little-endian byte order, 0x 0007 is converted to decimal 7, indicating that the horizontal positioning accuracy value is 7
0B	26 00	26 00 is the little-endian byte order, 0x 0026 is converted to decimal as 38 , indicating an altitude of 38 m
16	00 00	00 00 is the little endian byte order, 0x 0000 is converted to decimal as 0, and through the calculation formula $0/100=0(V)$, it means that the analog value of port AD1 is 0
17	00 00	00 00 is the little endian byte order, 0x 0000 is converted to decimal as 0, and through the calculation formula $0/100=0(V)$, it means that the analog value of port AD2 is 0
19	A2 01	A2 01 is the little endian byte order, 0x 01 A2 is converted to decimal as

		418 , and the calculation formula $418 / 100 = 4.18$ (V) indicates that the analog value of port AD3 is 4.18V (battery power)
1A	26 05	26 05 is the little endian byte order, 0x 0526 is converted to decimal as 1318. By calculating the formula $1318 / 100 = 13.18$ (V) , it means that the analog value of port AD4 is 13.18V (external power supply)
40	23 00	23 00 is the little endian byte order, 0x 0023 is converted to decimal 35 , indicating that the event code is 35. Refer to Chapter 4 (Event Code Table) to know that event 35 is Track By Time Interval

f) Total number of four-byte IDs

in gray , 0x 06 is converted to 6, which is 6 in base 10 , indicating that the total number of four-byte IDs is 6. that is, $N = 6$

g) Four-byte ID information

Since the parameter 0x FE2F is not included , q = 0. The data is marked in brown . The excerpt is as follows:

02 D7 87 57 01 03 48 60 CC 06 04 DE

BF B5 24 0C 80 68 00 00 0D E4 A0 03 00 1C 01 00 00 00

Detailed analysis of four-byte ID as shown

ID	content	Description and explanation
02	D7 87 57 01	D7 87 57 01 is the little endian byte order, 0x 015787 D7 is converted to decimal 22513623 , and the formula is $22513623 / 1000000 = 22.513623$, indicating that the latitude is 22.513623
03	48 60 CC 06	48 60 CC 06 is the little endian byte order, 0x 06 CC 6048 is converted to decimal 114057288 , and the formula is $114057288 / 1000000 = 114.057288$, indicating that the longitude is 114.057288
04	DE BF B5 24	DE BF B5 24 is the little endian byte order, 0x 24 B 5 BFDE is converted to decimal 615890910 , with 0:0:0 on January 1, 2000 as the starting point
0C	80 68 00 00	80 68 00 00 is the little endian byte order, 0x 00006880 is converted to decimal 26752 , indicating that the mileage is 26752 m
0D	E4 A0 03 00	E4 A0 03 00 is the little endian byte order, 0x 0003 A0E 4 is converted to decimal 237796 , which means the running time is 237796 seconds (2 days, 18 hours, 3 minutes, 16 seconds)
1C	01 00 00 00	Since the event code of this message is 35 , this data is valid. 01 00 00 00 is the little endian byte order. Bit 0 of 0x 00000001 is set (bit 0 = 1) , indicating that the EEP 2 parameter has been modified.

h) Total number of IDs with non-fixed bytes

Use dark green to mark, 0x 01 is converted to 1 in decimal , indicating that the total number of non-fixed byte IDs is 1

i) ID information with non-fixed bytes

in red , the excerpt is as follows

49 09 04 01 00 00 00 00 00 00

Detailed analysis of non-fixed byte ID , and find that there is only one non-fixed byte ID , which is 0x49 (camera status information) as shown

Fields	content	Description and explanation
ID length	09	0x 09 , converted to decimal is 9, so the ID length is 9 bytes
The total number of cameras supported by this device	04	0x 04 , converted to decimal, is 4. The device supports up to 4 cameras.
Camera access status	01 00 00 00 00 00 00 00	01 00 00 00 00 00 00 00 is little-endian byte order, and bit 0 of 0x 0000000000000001 is 1 , indicating that only the camera of channel 1 is connected

3 The ID list of AEC101

Brief description	description	ID	unit
ClutchSw	clutch pressed down	0x1F	bool
BrakeSw	brake pressed down	0x20	bool
CCActive	cruise control active	0x21	bool
ReqSupport	requests supported	0x22	bool
